No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Biochem. Biophys. Res. Commun. 211:586-589 (1995).

-!-FUNCTION! May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the PI position. SCCE cleaves insulin B chain at 6-Leu-| -| Cys-7, 16-Tyr-| -Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

-!- SIMILARITY: Belongs to the peptidase SI family. Kallikrein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hansson L., Stroemqvist M., Baeckman A., Wallbrandt P., Carlstein A.,

                                                                                                                                                                                           in disease vector mosquitoes after blood feeding.
SUBCELLULAR LOCATION: Integral membrane protein (Potential).
TISSUE SPECIFICITY: Female-specific antennae and maxillary palp
                                                                                                                                                                                                                                                                expression.
INDUCTION: Strong response to the odorant 4-methylphenol, a component of human sweat, when expressed in odorant receptor deficient Drosophila. In vivo, decreased expression in antennae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pfam; PF02949; 7tm_6; 1.

OTHER INFORMATION: enzyme (scce) catalytic domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                         APPLICANT: O'Brien, Timothy J.
APPLICANT: O'Brien, Dimothy J.
APPLICANT: O'Brien, Lowell J.
TITLE OF INVENTION: No. 6642013e1 Extracellular Serine Protease
TITLE OF INVENTION: No. 6642013e1 Extracellular Serine Protease
CURRENT APPLICATION UNMER: US/99/618,259
CURRENT FILING DATE: 2000-07-18
PRIOR APPLICATION NUMBER: US 09/127,444
PRIOR FILING DATE: 1998-08-21
NUMBER OF SEQ ID NOS: 72
SEQ ID NOS: 72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 12, Application US/08557146

| Sequence 12, Application US/08557146
| Patent No. 5834290
| GENERAL INFORMATION:
| APPLICANT: Egeltud, Torbjorn
| APPLICANT: Hansson, Lennart
| TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic
| TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic
| TITLE OF INVENTION: Brayme (SCCE)
| NUMBER OF SEQUENCES: 17
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: White & Case, Patent Department
| STREET: 1155 Avenue of the Americas
| CITY: New York
| COUNTRY: U.S.A. |
| STATE: New York
| COUNTRY: U.S.A. |
| COMPUTER READABLE FORM: WEDIUM TYPE: Floppy disk
| COMPUTER: IBM PC compatible |
| OPERATING SYSTEM: PC-DOS/MS-DOS |
| COMPUTER: BATE: 14-DEC-1995 |
| CLASSIFICATION NUMBER: US/08/557,146 |
| PILING DATE: 14-DEC-1995 |
| ATTORNEY/AGENT INFORMATION: NAME: Sterner, Richard J. |
| REGISTRATION NUMBER: 1103326-181 |

Patent No. 6451500

GENERAL INFORMATION:
APPLICANT: O'Brien Timothy J.
APPLICANT: Tanimoto, Hirotoshi
ITILE OF INVENTION: TADG-15: An Extracellular Serine Protease
ITILE OF INVENTION: TADG-15: An Extracellular Serine Protease
ITILE OF INVENTION: Overexpressed in Carcinomas
FILE REFERENCE: D606411P/D
CURRENT APPLICATION NUMBER: US/09/644,600

CURRENT APPLICATION NUMBER: 09/421,213
FRIOR APPLICATION NUMBER: 09/421,213
FRIOR APPLICATION NUMBER: 09/027,337
FRIOR FILING DATE: 1998-10-20
FRIOR APPLICATION NUMBER: 09/027,337
FRIOR FILING DATE: 1998-02-20
FRIOR APPLICATION NUMBER: 09/027,337

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                           Sequence 4, Application US/10461787

Sequence 4, Application US/10461787

Publication No. US20030199010A1

GENERAL INFORMATION:

APPLICANT: O'Brien, Timothy J.

TITLE OF INVENTION: No. US20030199010A1e1 Extracellular Serine Protease;
FILE REPERENCE: D602CIP2.

CURRENT APPLICATION NUMBER: US/10/461,787

CURRENT APPLICATION NUMBER: US/09/618,259

PRIOR APPLICATION NUMBER: US 09/127,444

PRIOR PILING DATE: 2000-0-18

PRIOR PILING DATE: 1998-08-21

NUMBER OF SEQ ID NOS: 72

SEQ ID NOS: 72
                                                    NAME/KEY: DOMAIN
OTHER INFORMATION: Amino acid sequence of stratum corneum chymotryptic
OTHER INFORMATION: enzyme (scce) catalytic domain
US-09-796-294-4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   OTHER INFORMATION: Amino acid sequence of stratum corneum chymotryptic OTHER INFORMATION: enzyme (scce) catalytic domain
                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                                                                                                                                                                                            Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                                                                                                                                                                               Human stratum corneum chymotrypsin enzyme peptide #3 (residues 5-13).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnosing cancer comprises detecting stratum corneum chymotrypsin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or an individual such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                                                                                                                                                   Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:33.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of [II]. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cutivity of (II) susful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (III) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in a polymucleotide sequences have applications of mutations diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule above; (6) an entible above each comprising the presence or amount of the above polypeptide or nucleic acid molecule in a cent of presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a comprising a nucleic acid molecule in a first mammalian subject; (9) a cerening for incenting a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (11) a method of cor preventing a pathology associated with the above polypeptide in a corporation and activity of the polypeptide described above; (12) a method for modulating cor preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a corporation and antilipaemic activities, and can be used in gene therapy. The collypeptide is useful in manufacturing a medicament for treating a cyndrome associated with a human disabase. The polypeptide or the nucleic corporation and benched for the activity of producining the above polypeptide is useful in manufacturing a medicament for treating a cyndrome associated with a human disabase. The polypeptide or the nucleic corporation and proved the corporation and particles and antilipaemic activities, and can be used in gene therapy. The colline associated with a human disabase. The polypeptide or the nucleic corporation and and particles or prevent metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia; metabolic syndrome X;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the

Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.

Claim 1; SEQ ID NO 96; 395pp; English

```
The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and conjuncted with decreased by a usefain or activity of NOVX by supplementing the patient our protectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polymucleotide expression and activity of NOVX cused to modulate NOVX polymucleotide expression and activity of NOVX cused to modulate NOVX polymucleotide expression and activity of NOVX cused to modulate NOVX polymucleotide expression and activity of NOVX cused to modulate NOVX polymucleotide expression and activity of NOVX polymetides and polymucleotides may be used in this way to prevent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, disorders, and the various dyslipidaemias metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence

(MILL/) (PEYM/) Matches ADN62896 The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising in one or more containers, the composition described above; in one or more comprising the mucleic acid molecule described above; (3) an isolated nucleic acid molecule of the invention; (4) a vector comprising the mucleic acid molecule described above; (5) a cell comprising the mucleic acid molecule described above; (5) a cell comprising the propertied described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above comprising a special devels of expression of the above comprising the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborent physiological interactions of the polypeptide; (11) a method of confidential interactions of the polypeptide; (11) a method of a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preduced with the polypeptide; (12) a method for modulating confidences have antidiabetic, anorectic, antibacterial, virucide, mammal; and (14) a method for producing the above polypeptide; NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and be essent for treating a medicament for treating a syndrone associated with a numbar of and antilipaemic activity and produce the produced the polypeptide of the poly New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or Dipippo VA; acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various Catterton E; Gno X; Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides. For example, NOVX polypeptides and conformable of the aberrant expression and polymucleotides may be used to treat disorders associated with decreased expression or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX bolymeticotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The used to modulate NOVX polypeptide antibodies and in this way to prevent, cused to modulate NOVX polypeptide antibodies may be used in this way to prevent, diagnose and treat: metabolic disorders, immune disorders, disorders, and the various dyslipidaemias, metabolic disorders, immune disorders, distorders, match bobsity, the metabolic syndrome X and the various dyslipidaemias, mad wait wasting disorders and with obesity, the metabolic syndrome X and wasting disorders associated with obesity, the metabolic syndrome S and cores.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Smithson G, Miller KA, Edinger SR, Ellermann, Catterton E; Patturajan M, Spytek KA, Edinger SR, Ellermann M, Catterton E; Ort T, Gorman L, Zerhenber BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo VA; Anngolli EA, Rieger DK, Spaderna SK;

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous sccoor its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a composition effective for the prevention or treatment of an abnormal byperkeratosis, eczema, acne and inherited skin diseases or pruritus, atopic dermatitis, eczema, acne and inherited skin diseases with the pidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     where itch is a component. This sequence represents the N-terminal tragment of the human stratum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                     Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serihe protease; transgenic mammal, skin; skin disease; skin cancer; hyperkertatosis; acanthosis; epidermal inflammation; dermal inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human amyloid precursor protein protease (AAW05383) is involved in the percessing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAY39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cpds. useful for treating or preventing contitions associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serihe protease; transgenic mammal; skhi, skhi disease; skhi cancer; hyperkeratosis; acanthosis; epidermal inflammation; derma inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal pyperkeratosis, epidermal inflammation, dermal inflammation, pruritus, atopic dermatitis, eczema, and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous with human kallikrein / (KLKA) and is used in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, protease, cancer, immune-related disorder, cardiovascular disease, neuronal-rassociated disease, metabolic disorder; inflammatory disorder; nervous system disorder, sexual dysfunction; pain; mood disorder; hypertension; psychotic disorder; neurological disorder; dyskinesia;
                                                                                                                                                                                                                                                                                                                                                      Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, Parkinson's useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises concerts and a subject having a prostate cancer, which involves contextion in a subject having a prostate cancer. Crasses which are differentially-regulated in prostate cancer. Freferably, the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide and prostate cancer cells with a test agent under conditions effection, of the test agent to modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, proventing or treating, determining predisposition to diseases and cancer sepecially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer. Crasses products are used in the diagnostic test to assay for presence of cancer. The polypeptide encoded by (I) can be used as target for therapy or drug diagnostic appropriate encoded by (I) can be used as target for therapy or drug efforts and groups of genes, expressed in pathways and thus concer. The identifications concerned by a polypeptide and droups of genes, expressed in pathways and the definition of functional markers and groups of genes, expressed in pathways which are useful in diagnostic, the representation of physiologically relevant to prostate cancer. The identifications of pathways which are useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein diferentially

Jay G; Sun Z,

WPI: 2003-058520/05. N-PSDB; ABX10375. Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 351; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapettic or preventive of the number is indicative of the probability that the sample comprises or prostate cancer. (C determining the expression levels in a sample comprising prostate cancer. (C target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (C is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer calls with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I is useful as modecular markers, as drug targets, and for detecting, daynosing, staging, and etermining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer of conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discourser, its stage of development, the number of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discourser, its stage of development, the pulypeptide and groups of genes, expression to determine the polypeptide encoded by (I) can be used for expression of specific applications to treat prostate cancer. The identification of in therapeutic pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein diferentially in prostate cancer

The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human stratum corneum chymotryptic enzyme - ovarian cancer clone O1676P.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
